

Debug Disaster (CTF@CIT 2026)

Description:

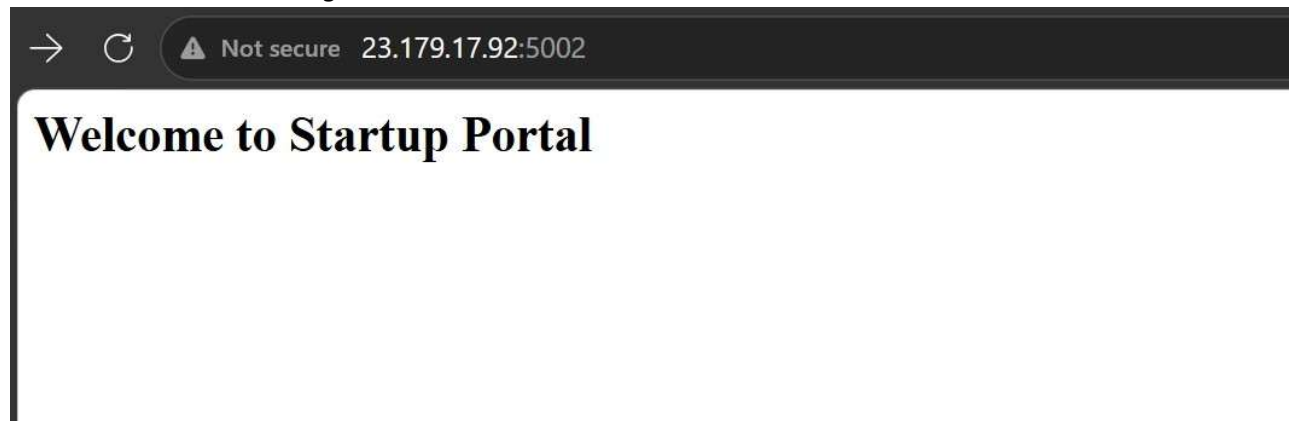

Developing this application is tough, and I needed debug mode to be enabled... but I'm nervous I forgot to turn it off in production. I also think I may have forgot to remove something from the application structure.

Overview

The webapp is presented with a static page but turn on `debug` functionality is **True**, which exposes error and internal endpoint outo the Internet. Access the private endpoint for flag.

Exploitation Flow

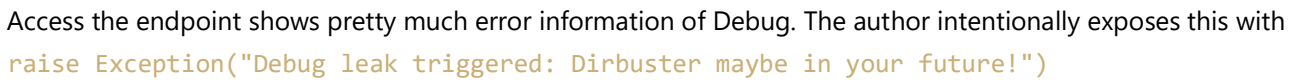

At first access, there nothing other than static content.

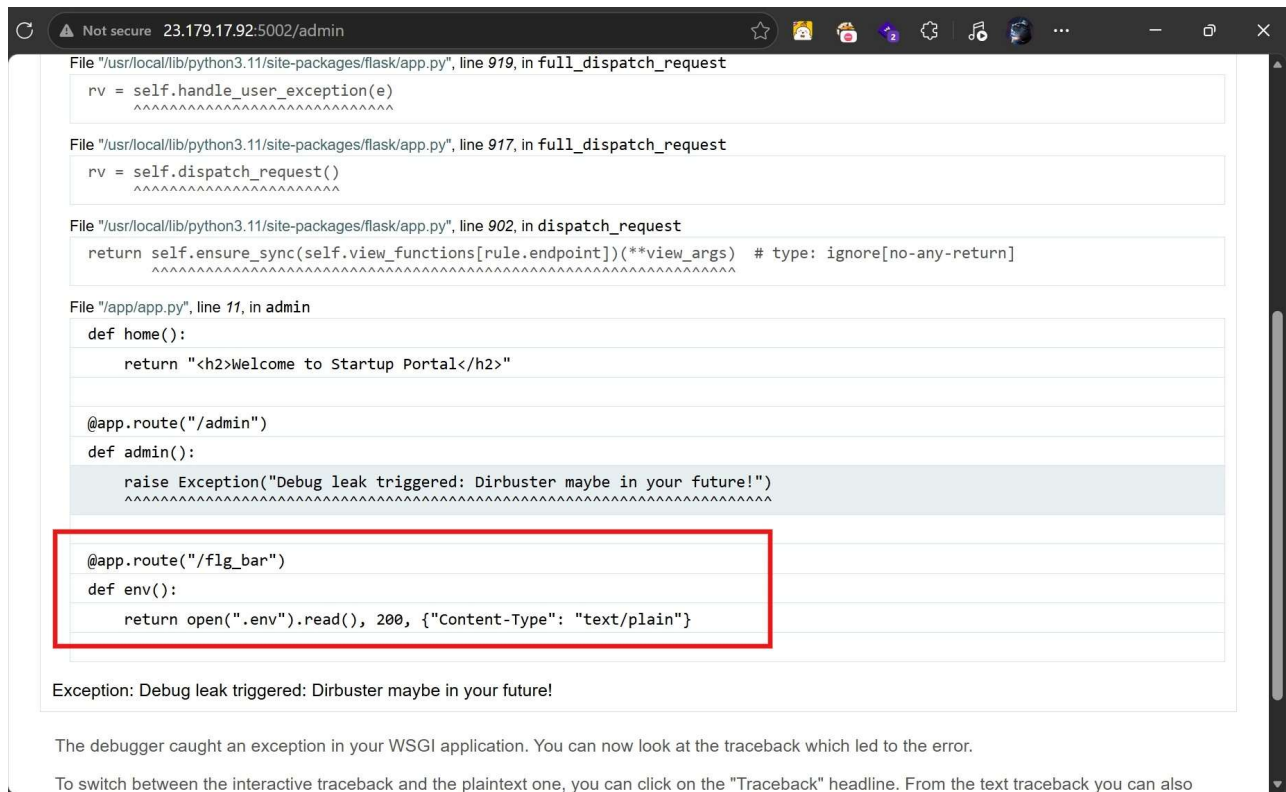

Try recon at `/robots.txt` get 404 Not Found

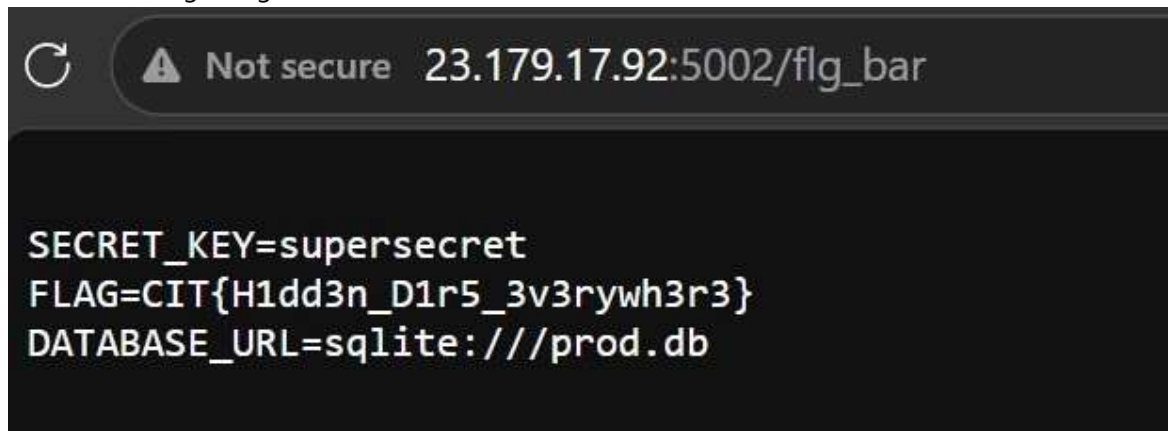

Based on the description, which is `debug = True`, and on the Wappalyzer I know that server using Flask and Werkzeug. When `debug = True`, there is a portal at `/console` allowing dev to run code from the web rather than in the docker.

Go to that and get flag

Flag: **CIT{H1dd3n_D1r5_3v3rywh3r3}**
